CSCE 3600: Systems Programming
Minor Assignment 4 – Using Linux Sockets
Due: 11:59 PM on Friday, November 19, 2021

PROGRAM DESCRIPTION:

In this assignment, you will write two complete C programs to support a client/server model using Linux sockets for a UDP "ping" utility, similar to the ping utility already available on our CSE machines.

- **Server**

    o The server program will be called with one command-line argument, the port number being used, such as `./minor4svr 8001`. If the user calls the server program with too few or too many arguments, you will print out a usage statement and terminate the program.

    o The server will set up a UDP socket on the Internet (i.e., INET) domain and then wait in an infinite loop listening for incoming UDP packets, specifically `PING` messages from a client.

    o *Packet Loss*

    UDP provides applications with an unreliable transport service. Messages may get lost in the network due to a variety of reasons. Since packet loss is rare or even non-existent in typical campus networks, the server in this lab will inject artificial loss to simulate the effects of network packet loss. The server will simulate 30% packet loss through generation of a seeded, randomized integer that will determine whether a particular incoming `PING` message is lost or not.

    o When a `PING` message comes in and if the packet is not lost, the server will print the client message to the terminal and then send a `PONG` message back to the client. If the packet is determined to be lost, the server will print an appropriate message to the terminal and simply "eat" the message by not responding to the client.

- **Client**

    o The client program will be called with two command-line arguments, the hostname of the server and the port number being used, such as `./minor4cli cse06 8001`. If the user calls the client program with too few or too many arguments, you will print out a usage statement and terminate the program.

    o The client will send 10 automated `PING` messages to the server on a UDP socket, where automated means the message is built in the code, not entered from the keyboard. Because UDP is an unreliable protocol, a packet sent from the client to the server may be lost in the network, or vice versa. For this

reason, the client cannot wait indefinitely for a reply to a `PING` message. You should get the client to wait up to one second for a reply – if no reply is received within one second, your client program should assume that the packet was lost during transmission across the network.

- o Specifically, for each of the 10 `PING` messages, your client program should:
  - send the `PING` message using the UDP socket and print a status message;
  - if the response message is received from the server, calculate and print the round trip time (RTT) in milliseconds for each message; otherwise, print a status message that it timed out.
- o After all of the PING messages have been sent (and responses received or timed out), the client program should report:
  - the number of messages sent, the number of messages received, and the message loss rate (as a percentage);
  - the minimum, maximum, and average RTTs for all of the `PING` messages in milliseconds.

Your program should run on the INET domain using SOCK_DGRAM (i.e., UDP) sockets so that the server and the client execute on a different CSE machine.

Given the randomness of what messages get dropped, it could be that less than or greater than 30% of the messages are dropped.

You will also need to make sure you are able to handle any error cases.

SAMPLE OUTPUT (user input shown in **bold**)**:**

==> SERVER on cse04

```
mat0299@cse04:~/csce3600/fa21$ ./minor4svr
usage: ./minor4svr <port>
mat0299@cse04:~/csce3600/fa21$ ./minor4svr 8001
[server]: ready to accept data...
[client]: PING
[client]: PING
[client]: PING
[client]: PING
[client]: PING
[client]: PING
[server]: dropped packet
[client]: PING
[client]: PING
[client]: PING

min: 0.228000 ms, max: 0.652000 ms, avg: 0.291889 ms
```

REQUIREMENTS:

- Your code should be well documented in terms of comments. For example, good comments in general consist of a header (with your name, course section, date, and brief description), comments for each variable, and commented blocks of code.

- Your programs should be named "**minor4svr.c**" and "**minor4cli.c**", without the quotes, for the server and client code, respectively.

- Your program will be graded based largely on whether it works correctly on the CSE machines (e.g., cse01, cse02, ..., cse06), so you should make sure that your program compiles and runs on a CSE machine.

- Please pay attention to the **SAMPLE OUTPUT** for how this program is expected to work. If you have any questions about this, please contact your instructor, TAs, or IA assigned to this course to ensure you understand these directions.

- This is an individual programming assignment that must be the sole work of the individual student. Any instance of academic dishonesty will result in a grade of "F" for the course, along with a report filed into the Academic Integrity Database.

SUBMISSION:

- You will electronically submit your two C source code files, minor4svr.c and minor4cli.c, to the **Minor Assignment 4** dropbox in Canvas by the due date.
